                                                                                                                                                                   The DNA probe is prepared by introducing an amino group at the 5' terminus of DNA or a nucleotide, followed by using transglutaminase to bond a labelling substance to the obtained DNA having the introduced amino group. The enzymatic reaction using transglutamase is advantageous in time and cost since many chemical reaction stages associateed with e.g. radiolabelling of probes can be by-passed. The enzymatic reaction is mild, decrease of activity of the labelled compound can be minimised and producibility is increased
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              terminus of DNA or anucleotide, followed by using transglutaminase to bond a labelling substance to the obtained by using transglutaminase to bond a labelling substance to the obtained DNA having the introduced amino group. The enzymatic reaction using transglutamase is advantageous in time and cost since many chemical reaction stages associateed with e.g. radiolabelling of probes can be by-passed. The enzymatic reaction is mild, decrease of activity of the labelled compound can be minimised and producibility is increased. Two PCR primers (AAQ46095, AAQ46095) were used to amplify DNA samples prepared from vibrio Parahaemolyticus WPl
Prepn. of DNA probe - by introducing amino gp. at 5'-terminal of DNA, then bonding labelling substance to DNA using transglutaminase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        of DNA probe - by introducing amino gp. at 5'-terminal of DNA, onding labelling substance to DNA using transglutaminase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

used in the chimeric non-human animal of the invention. The chimeric non-human animal of the invention, preferably a mouse, contains a foreign chromosome(s) or chromosome fragment. The animal is produced by obtaining a hybrid cell by fusion of a cell containing the foreign chromosome with a cell having the ability to form microcalls. The microcalls are prepared, and fused with cells having differentiative pluripotency and containing the foreign chromosome. These cells are then introduced into an embryo, which is then implanted and brought to term. The foreign chromosome segment is at least implanted and brought to term. The foreign chromosome segment could also contain genes associated with human chromosome segment could also contain genes associated with human disease, such as the interleukin-2 gene, and the Huntington's disease contain genes associated with man animal is useful for efficient production of proteins, especially human animal is useful for efficient production of proteins, especially contains animal which
                                                                                                                                                                                                                                             ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAT92758-T92817 represent amplification primers for human genes which are
The sequences given in AAT85489-90 are oligos which hybridise under stringent conditions to the cDNA encoding the human augmenter of liver regeneration protein (hALR). The hALR genomic sequence was isolated from human chromosome 16 by exon trapping, hALR cDNA encodes a 119 amino acid protein which is 84.8% identical and 94.1% similar to the rat ALR protein. The hALR gene is specifically isolated from the chromosome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PCR primer; amplify; human gene; chimeric non-human animal; antibody; transgenic mouse; chromosome fragment; hybridoma production; microcell; Huntington's disease gene; pluripotent cell; interleukin-2 gene; myeloma cell; immunoglobulin; variable region; ss.

Genome (represented in AAX10269-X12937). These primers dund in the human genome (represented in AAX10269-X12937). These primers can be used in a method for determining polymorphic forms in an individual for use in e.g. of crensics, paternity testing or four phenotypic typing for diseases such as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Addrich syndrome, Fabry's disease, familial hypercholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary haemorrhagic telangiectesia, familial colonic polyposis, Bhlers-Danlos system, infection by pathogenic microorganisms, and characteristics such as longwitty, appearance (e.g. baldmess, obesity), strength, speed, endurance, fertility, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid segments can also be used to produce medicaments for the treatment or prophylasis of endurance.
                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAX09121-X10268 are allele-specific oligonucleotide primers used in the
             myeloma cells to produce hybridomas capable of expressing the foreign gene (e.g. to produce the antibody)
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Polymorphism; biallelic; human; forensic; paternity testing; disease; detection; phenotypic typing; characteristic; infection; hereditary; autoimmune disease; cancer; inflammation; drug; therapy; medicament;

ALR is a growth factor which augments the growth of damaged liver tissue while having no effect on the resting liver. Rat ALR has been shown to be capable of augmenting hepatocytic regeneration following hepatectomy. The antisense oligonucleotides of the present sequence are used to modulate expression of hALR and prevent its translation. Antibodies against hALR can be used to block binding of its naturally occurring ligands. Host cells containing vectors with DNA inserts encoding the protein can be used in a method for identifying compounds which bind to hALR. hALR could be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human chromosome 16 genes encoding netrin, ATP binding cassette transporter, ribosomal L3 and augmenter of liver regeneration proteins - useful for, e.g. treatment of liver disease and cystic fibrosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human, augmenter of liver regeneration, hALR; treatment; modulation; expression, antibody; identification; binding; substrate specificity; ligand; exon trap; damaged liver; treatment; PCR primer; amplify; ss.

A replication or expression vector comprising CDNA sequences encoding EP-3V or EP3-3VI can be used to transform a host cell. The host cell is cultured and the polypeptides can be recovered from the culture medium. The polypeptides combine specifically with a prostaglandin PGE2 receptor and can be used as a preventive and treating agent for inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Pluripotent cell; intrinsic gene; chimeric non-human animal; construction; human; antibiotic gene; cancer cell; embryonic; PCR primer;

Protein containing PDZ domain, whose expression is enhanced by TNF stimulation - plays an important role in protein/protein interactions and is used for screening for proteins for use in treatment of cell proliferation disorders such as cancer.
                                                                                                                                                                                                                                                                                                                                     This sequence represents a primer use to amplify and isolate clones which encode new proteins containing PDZ domains whose expression in human umbilical vascular endothelial cells (HUVBC) are enhanced by stimulation with tumnour necrosis factor (TNF) alpha. The new protein is used to identify proteins which bind to it (particularly to the PDZ domains) and the genes encoding them, for use in the treatment of cell proliferation disorders such as cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Protein containing PDZ domain, whose expression is enhanced by TNF stimulation - plays an important role in protein/protein interactions and is used for screening for proteins for use in treatment of cell proliferation disorders such as cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Primer 1192-1161 for PDZ domain-containing protein gene clone 32-8-1/5R3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents a primer used to isolate the clone 32-8-1/5R3
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PDZ domain; gene expression; human umbilical vascular endothelial HUVEC; stimulation; tumour necrosis factor; TNF; protein binding; cell; proliferation disorder; cancer; primer; amplification; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                  containing foreign chromosomes or their fragments (preferably at least containing foreign chromosomes or their fragments (preferably at least cells containing the foreign chromosomes or fragments, then fusing these with pluripotent cells such as embryonic stem cells, embryonic cancer cells or their mutants. Also reproductive cells, embryonic cancer cells or their mutants. Also described are: (1) a method of obtaining hybridoma cells by fusing a cell with a high ability to produce hybridoma cells (such as mouse Ag cells) with a cell containing the foreign chromosomes or fragments (such as normal human diploid cells); (2) a method of utilising pluripotent cells to produce chimeric and transgenic non-human animals (especially mammals such as mice) which can express the foreign chromosomes or fragments cuch as mice) which can express the foreign chromosomes or fragments cells derived from the offspring production of monoclonal antibodies for inventions can be used for the production of monoclonal antibodies for medical use which are of human type and therefore not antipodies for humans type and therefore not antipodie or the champers. They can also be used in the production of chimeric and cransgenic animals which express use setul foreign proteins, or which can serve as models for the study of human diseases. AAV52755 to AAV5288 are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ó

which encodes a new protein containing PDZ domains whose expression in human umbilical vascular endothelial cells (HUVEC) is enhanced by stimulation with tumour necrosis factor (TNF) alpha. The new protein is used to identify proteins which bind to it (particularly to the PDZ domains) and the genes encoding them, for use in the treatment of cell proliferation disorders such as cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 density gene chip, specifically for making high-density micro-array of oligonucleotide probes. An oligonucleotide probe selecting process to oligonucleotide probes and coverage variable probes to provided to ensure identical cross melting temperature of probes is provided to ensure identical cross melting temperature of probes to the maximum limit, and this can make the cross control of gene chip relatively simple and raise the reliability of the gene chip detecting results. The proposes a specific probe selection method for detecting target sequence directly, detecting mutation in both specific and non-specific sites and a probe overall arrangement scheme. AAA79738 to AAA80201 represent oligonucleotide probe sequences which are used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a method which comprises making a high-

The method comprises:

(a) Fusing a microcell comprising the foreign chromosome or chromosome fragment, with a cell having a high efficiency for homologous excombination; (b) marking the desired site of insertion of the foreign chromosome using a targeting vector; and (c) inducing deletion or translocation at the marked site. Transgenic animals produced by the method are useful to provide disease models and knockout animals, and in the production of human proteins, particularly human antibodies. This sequence is used in the method of the invention
                                                                                                                                         Foreign chromosome; microcell fusion; homologous recombination; antibody; targeting vector; transgenic animal; disease model; knockout animal;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Producing a cell containing modified foreign chromosomes, useful for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             NO: 14.

The present sequence is human secreted Frizzled-related protein 4 (sFRP4) gene specific reverse transcription PCR (RT-PCR) primer. The invention relates to a method for treating or preventing chronic obstructive pulmonary disease (COPD) such as emphysema, asthma and chronic bronchitis in a subject. The method involves administering to the subject, an agent effective to inhibit apoptosis by inhibiting the expression of a secreted Frizzled-related protein (sFRP) gene. It is also useful in antisense
                                                                                         The present invention provides a number of oligonucleotides which selectively hybridise to either Vibrio parahaemolyticus. Escherichia coli or Staphylococcus aureus genes. These organisms are associated with food poisoning, and the sequences can be used to determine its cause and thus determine the appropriate treatment. The present sequence is one of the
labile genes of toxigenic Escherichia coli, useful as primers for gene amplification to detect E. coli in cases of food poisoning, diarrhea or in food inspection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Inhibition of apoptosis for the treatment or prevention of obstructive pulmonary disease comprises inhibiting expression of secreted Frizzled-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Secreted Frizzled-related protein; sFRP; chronic bronchitis; asthma; chronic obstructive pulmonary disease; COPD; antisense therapy; human; emphysema; reverse transcription PCR; RT-FCR primer; sFRP4 gene; ss.

The invention relates to a method of obtaining a stable transplastome, by transforming a recipient plastome (RP) with a polynucleotide having a 5' sequence homologous to a region of RP, and joined to it, a sequence heterologous to Recomprising a coding region operably linked to regulatory region capable of securing expression of coding region in the plastid and joined to it, and a 3' sequence homologous to a region of RP. The method is useful for obtaining a transplastomic plastid, by transforming a plastome within a plastid such as proplastid, amyloplast, chromoplast, etioplast or leucoplast, preferably chloroplast. The method is useful for obtaining a transplastomically expressed protein. The method provides high, uniform, reliable expression of transgenes in plants, with stable inheritance of the trait by avoiding the potential for the dangerous spread of transgenes to the ecosystem. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human Nck-2; adapter protein; Nck adapter protein; hNck-beta; Grb4; signal transduction; SH2 domain; SH3 domain; src homology domain; integrin signalling; receptor tyrosine kinase signalling; growth factor receptor signalling; PINCH; v-Abl; Ras; SOS; transcriptional activation; cancer; tumour; leukaemia; breast cancer; expression inhibition; phosphorothioate; antisense oligonucleotide; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Obtaining a stable transplastome for producing a transplastomic cell, plant or seed, comprises transforming a recipient plastome with a polynucleotide comprising a 5' and 3' sequence homologous to the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human Nck-2 phosphorothioate antisense oligonucleotide, SEQ ID NO:77.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               sequence represents a PCR primer used in primer extension assays for

The present invention provides the sequences of a number of oligonucleotides which selectively hybridise to the Staphylococcus aureus enterotoxin A, B, C, Dor E genes. Also provided are the sequences of probes for Escherichia coli and Vibrio parahaemolyticus genes. These are useful in the identification of the cause of food poisoning in humans, and in food inspection procedures
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Genes and proteins involved in the upstream of the pathway of degradation
                                                                                                                                                                                                                                                                                                   New oligonucleotides that are selectively hybridizable with the entA, B, C, D or E gene of Staphylococcus aureus, useful as primers for gene amplification to selectively detect S. aureus in cases of food poisoning or in food inspection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to coding sequences for proteins such as aromatic dihydrodiol dehydrogenase, aromatic diol oxygenase, hydratase-
                                                                                                                                                                                       Shirasaki Y;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Aldehyde-dehydrogenase; enzyme; phenanthrene; anthracene; PCR primer; aromatic dihydrodiol dehydrogenase; aromatic diol oxygenase;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     .

The antisense oligonucleotides were designed to target different regions of the human Nck-2 miNUA, and were analysed for their effect on Nck-2 miNUA levels by Collyannucleotides were analysed for their effect on Nck-2 miNUA levels by Mck-beta and Grb4), contains both SH2 and SH3 suc homology domains and functions as an adapter protein in integrin—mediated and receptor Tyrosine kinase-mediated signal transduction, particularly in growth factor receptor signalling and integrin signalling via its connect growth factor signalling and integrin signalling via its interaction with PINCH, a LIM domain-containing adapter protein which is interaction with EGF (epidermal growth factor) and Which is involved in integrin, growth factor and Whit signalling pathways. Nck-2 also interacts with EGF (epidermal growth factor) and Which is synthesis in an SH2-dependent manner. Nck-2 is also able to interact with CG Therefore implicated in the development of cancer, particularly leukaemia and breast cancer. The oligonucleotides of the invention are useful for extraction, such as leukaemia and hyperser cancer. The oligonucleotides of the invention are useful for extracted in the development of cancer, particularly leukaemia and hyperser cancer. The oligonucleotides of the invention are useful for extraction, and is such as leukaemia and hyperser cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                            Novel antisense compound which inhibits expression of human nck-2 useful for treating disease or condition associated with expression of nck-2, and as research reagents, kits and diagnostics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

The patent discloses a method of producing a protein of interest which involves expressing a polynucleotide fusion construct in a plastid to produce a fusion protein comprising the protein of interest where the construct comprises a polynucleotide coding sequence of the protein of interest operably linked to a polynucleotide coding sequence of a fusion or protein partner. The methods of the invention are useful for producing a protein of interest which comprises a human protein or its biologically active variant or fragment, a pharmaceutically active protein, an IFN damma or its biologically active variant or fragment. They are useful for the production of transgenic plants. Methods of the invention are also useful for the generation of transplastomic plant cells, plants and seeds. The protein of interest obtained by the methods of the invention is useful for the manufacture of a medicament for treating a disease
aldorase and aldehyde-dehydrogenase (ABA01198-ABA01201 and AAM52344-AAM52347), which are involved in the degradation of polycyclic aromatic compounds. The enzymes are useful as reagents for converting the metabolite intermediates of polycyclic aromatic compounds such as phenanthrene and anthracene. The present sequence is a PCR primer, which
                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Producing a protein of interest, e.g., a pharmaceutically active pro comprises expressing a polynucleotide fusion construct in a plastid producing a fusion protein comprising the protein of interest.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Primer #13 related to the method of producing a desired protein.

The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying cells in which both alleles of a gene are modified, comprising modifying cone allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by concurred. On the expression of the second allele is regulated by the promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles of a gene are modified. The diploid fungal cells having both alleles modified are useful for identifying a gene that contributes to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus a gene that contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a diploid fungus and for identifying a therapeutic agent for treatment of a mammalian disease. (M1) is useful for identifying a compound which modulates the activity of a gene product, preferably enzymatic activity, carbon compound carabolism, biosynthetic, transporter, transcriptional, translational, signal transduction, DNA replication and cell division activity. The method is useful for identifying a compound having the activity to inhibit growth or proliferation of C. albicans cells and for the present used in the method of the invention. Note: The sequence dat for the present is that of a per product the present sequence of a per product of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   oŧ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional expression.
                                                                                                                                                                                                                                                                                                                             Fungus; yeast; tetracyclin; promoter; GRACE strain; biosynthesis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a new antisense compound targeted to inhibiting the expression of human glioma-associated oncogene-2. The invention is useful for thinditing the expression of human glioma-associated oncogene-2 in cells or tissues. The invention is also is useful for treatment of diseases associated with human glioma-associated oncogene-2. The invention is further useful for disquisping thindings, prophylaxis, as research reagents and kits, for distinguishing functions of various members of a biological pathway, and in antisense gene therapy. The invention is also useful prophylactically, e.g., to prevent or delay infection, inflammation or tumour formation. The present nucleic acid sequence represents an objective that was used in the methods of the

The present invention describes a method (M1) for designing capture oligonucleotide probes (I) for use on a support to which complementary oligonucleotide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and Aspergillus fundgaturus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and polio virus, and parasitic infectious agents c.g. Salected from Onchowerava volvulus, Entamoeba histolyfica and Dracunculus comedinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.

CC medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects.

CC Detecting cancer involving oncogenes, tumour suppressor genes or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, p53 gene, human papillomavirus types 16 and 18 and liver cancers. The centend is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the computer of particular sites and indentifying if ligation of the oligonucleotide probe companion invarious types 16 and sequences. The invention relates to a novel polynucleotide isolated and purified from a human gene having any one of 935 fully defined sequences as given in specification, or a sequence having a base substitution. The invention further relates to: an oligonucleotide containing single nucleotide polymorphisms; a PCR primer set chosen from the combination of two DNA fragments from any one of 1220 fully defined sequences as given in specification; a labelling probe containing the SNP containing oligo; and a microarray equipped with the SNP containing oligo. The isolated human gene of the invention is useful for detecting the single nucleotide polymorphisms in human gene. The isolated human gene is also useful for diagnosis of disease and determination of side effect to a medical agent. The isolated human gene is also effective in detecting single nucleotide polymorphism in a human gene. This polymucleotide sequence represents one of the PCR primers used in the single nucleotide polymorphism
                                                                                                                                                                                                                                                       Novel polynucleotide useful for detecting single nucleotide polymorphisms
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human, antisense, lung dysfunction, nasal airway dysfunction, antinflammatory steroid; ubiquinone, antiinflammatory, antiallergic; antiasthmatic; hypotensive; townstathmatic; hypotensive; townstathmatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy; lung inflammation; respiratory disease; ds.

The antisense oligonuclectides of the invention are useful for treating: hyperproliferative disorders (e.g. breast cancer), or an autoimmune disorder (e.g. rheumatoid arthritis). The present DNA sequence represents a 2'-O-methoxyethy! gapmer oligonuclectide with a phosphorothioate backbone that is targeted to mouse TGF-beta receptor II.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention comprises antisense oligonucleotides that are targeted to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       reansforming growth factor beta-receptor II, useful for preparing a
composition for treating hyperproliferative disorder e.g., lung, liver,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          human; single nucleotide polymorphism; microarray; side effect; ss;

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding resign, 5 or 3 end genomic flanking regions, 5 or 3 and 3 intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or coding record and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention comparishment of masal airway dysfunction and ubiquinone. A composition may have a nutiinflammatory antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also confit or enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of, or reducing sensitivity to adenosine, reducing levels of, or reducing sensitivity to adenosine, reducing bronchoconstriction, lung suffactant in a subject's tissue, or treating bronchoconstriction, lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed or specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the intiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 mucleotides of junctions of genes encoding a polypeptide associated with lung and/or assal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a immunosuppressive, and cytostatic activity. The composition may have a come in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of antiinflammatory steroid in a subject, for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung surfactant in a subject's tissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO cat fip.wipo.int/pub/published_pot_sequences
                                                                                 Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' initron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of denosine creceptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of uniquinnon or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Once: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                  Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

                                                                                                    The specification describes a method of immortalizing progenitor cells, including neural progenitor cells. The method comprises providing a population of progenitor cells and immortalizing the population of the progenitor cells either before or after they are enriched or purified. The method is useful in immortalizing neural progenitor cells that may be used in treating injuries (e.g. brain or spinal cord injuries) and other diseases. PCR primers ABZ77435-36 were used to amplify cDNA encoding Ngn2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion, antiallaergic; antiinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cytostatic; gystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory diserses syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; pulmonary transplantation rejection; ss; primer.
brain or spinal cord injuries), comprises providing a population of progenitor cells and immortalizing the cells before or after they are enriched or purified.

surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery or the invention also adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and associated inflammation, allergies and/or surfactant hypoproduction are associated distress endiation such as pulmonary vascomestriction, cinflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary contraction, and contraction the emphysema, chronic obstructive pulmonary disease, pulmonary contractions and contraction and pulmonary contractions and contraction obstruction and contractions and contractions on a such as pulmonary diseases, pulmonary contractions on a such as pulmonary contractions on a such as pulmonary contractions on a such as pulmonary diseases, pulmonary contractions on a such as contractions on a such as pulmonary contractions on a such as contractions on a such as pulmonary contractions on a such as contraction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to

comprising objectives a mover composition, an arrive agency, comprising objective and control describes a factive of adenosine (A) or (A) receptors, reducing adenosine (A) or (A) receptors, reducing adenosine of hyposecretion, when administered to a mammal. The objection or hyposecretion, when administered to a mammal. The objection of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mkNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the objectives, (c) and paparate containers, (b) the objectives, (c) and paparate containers, (b) the objectives, or the invention has antiallergic, antiinflammatory, antiasthmatic, anticutions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analymention and composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production of reduce the amount of target polypeptide present in the lungs. The reduce the amount of target polypeptide present in the lungs. The composition and/or bronchoconstriction and/or lung
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, with a disease or condition such as pulmonary vasoconstriction, full almantion, allergies, asthma, impeded respiration, respirator, transplantation, respirator, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                   invention describes a novel composition (a) a first active agent,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                         oligonuclectide containing less percentage of adenosine, targeted unucleic acids associated with lung airway or lung dysfunction, and

of the invention has antiallergic, antilifammatory, antiathmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary cransplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory fract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to
                                                                                                                                                                                                                                                                                                                                Pharmaceutical composition for treating asthma, has antisense oligonuclectide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and
                                                                                                                                                                                                    Pabalan J, Aguilar D;
                                                                                                                                                                                                    Katz E,
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 15; SEQ ID NO 258; 763pp; English.

New human G-protein coupled receptor polypeptide and polynucleotide, useful for diagnosing, preventing, treating or ameliorating a medical condition, e.g. reproductive disorder, immunodeficiency disease or testicular cancer

Example 4; SEQ ID NO 90; 290pp; English.

The invention relates to an isolated muman of proteins receptor proteins minus the start methionine (and the region of the polymorlectide proteins minus the start methionine (and the region of the polymorlectide proteins minus the start methionine (and the region of the polymorlectide condition). The proteins are designated HGRRBWY30-1, HGRBBWY30-2, HGRBBWY30-2, HGRBBWY31-1, HGRBBWY41-2, HGRBBWY41-3, HGRBBWY42-1, HGRBBWY41-1, HGRBBWY44, Also included are expression vectors, host cells, antibodies, preventing (treating or ameliocating) a medical condition comprising administering to a mammalian subject the polypeptide or its modulator and diagnosing a pathological condition or a susceptibility to a pathological condition in a subject the polypeptide or the presence or amount of expression of the polypeptide. The human G-protein coupled receptor polypeptide or a backoff or a susceptibility to a pathological condition based on the polypeptide or polymorlectide can be used for diagnosing a pathological condition or a susceptibility to a pathological condition, such as the polypeptide or polymorlectide can be used for diagnosing a pathological condition or a susceptibility to a pathological condition, such as a disorder related to aberrant G-protein coupled receptor activity, and for preventing, treating or ameliorating a medical condition, such as disorder related to aberrant G-protein coupled respond to the polymetic or polymorlectic or a disorder, infertility, Klinefletter's syndrome, Xmale, disorder, infertility, Klinefletter's syndrome, Xmale, capididymitis, genital warts germinal cell aplasia, cryptcochidism, complete puberty, Kallman syndrome, Viral orchitis, serion an immune disorder, a proliferative immune disorder, prevamenture puberty, kallman syndrome, Cushing's syndrome an immune disorder, a proliferative immune disorder, prevamenture puberty, kallman syndrome, Cushing's syndrome, an immune disorder, a proliferative immune disorder, prevamenture, manel an immune disorder, a proliferative immune disorder The invention relates to an isolated human G protein-coupled receptor

autoimmunity disorders, such as autoimmune infertility, demyelination, systemic lupus erythematosus, drug induced haemolytic anaemia, Sjogren's disease, scleroderma, T-cell maturation disorders, B-cell maturation disorders, vascular disorders, stroke, ischaemia, myocardial infarction, atherosclerosis, embolisms, thrombosis, gastrointestinal disorders, irritable bowel syndrome, ulcers, pulmonary disorders, brain disorders, endocrine disorders, or ovarian, stomach, colon or kidney cancer or its related proliferative condition (many other diseases and disorders are listed in the specification). The antibodies may be used to purify, detect and target the G-protein coupled receptor polypeptides. The polymucleotides are also useful in gene therapy. The present sequence is a gene specific PCR primer for a nucleic acid encoding a novel GPCR of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /mod_base= OTHER

New antisense oligonucleotide targeted to nucleic acid encoding

```
The invention relates to a compound 8-80 nucleobases in length targeted to, and which specifically hybridises with a nucleic acid molecule encoding endothelial differentiation gene 5 (EDG5, a G protein coupled receptor, involved in development, wound healing, tissue regeneration, cellular proliferation, apoptosis, cancer, angiogenesis and cellular proliferation, and inhibits the expression of EDG5, i.e. is an antisense compound and a carrier or diluent and a method for screening an antisense compound (by contacting a preferred target region of a nucleic acid molecule encoding EDG5 with one or more candidate antisense compound (by contacting a preferred target region of a nucleic acid compounds comprising at least an 8-nucleobase portion that is compounds compounds that inhibit the expression of a nucleic acid encoding EDG5. The compounds that inhibit the expression of a nucleic acid encoding EDG5. The compound, composition and methods are useful for treating a disease or condition associated with EDG5, such as a hyperproliferative disorder, apoptosis. They are also useful in research and diagnostics for modulating the expression of EDG5. Experimental protocols are described to the contacting and and diagnostics for the contacting and are given. The present sequence is an AS oligonucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            .
0
endothelial differentiation sphingolipid G-protein-coupled receptor 5, for treating cancer, developmental disorder or a condition arising from aberrant apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                pigmentosum; ataxia telangiectasia; Chediak-Higashi syndrome;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention provides isolated polypeptides designated oncoseqx and their encoding polymoclecrides. The invention is useful for diagnosing, prognosing and developing a therapeutic strategy for the pathology which includes cancer, tumour, carcinoma, sarcoma, blastoma, lymphoma, leukaemia and neoplastic disease. The invention is also useful for treating hyperproliferative disorders, Gardner's syndrome, hereditary exostosis, polyendocrine adenomatosis, Peutz-Jeghers syndrome, hereditary constosis, polyendocrine adenomatosis, Peutz-Jeghers syndrome, hereditary envoitoin and pheochromocytoma, retinoblastoma, carcinoma with amyloid production and pheochromocytoma, retinoblastoma, acroid body tumour, cutaneous melanocarcinoma, intraocular melanocarcinoma xeroderma pigmentosum, ataxia telangiectasia, Chediak-Higashi syndrome, albinism, Fanconi's aplastic anaemia and Bloom's syndrome. The invention is also useful in gene therapy. The present sequence is a PCR primer used to amplify insulin-like growth factor 2 DNA. The primer is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                         .;

antidiabetic, immunomodulator, cardiant, neuroprotective, antiantlammatory, neuroprotective, nootropic, antiarthritic, vasotropic, ophthalmological, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used for preparing a composition for treating a disease or condition associated with mPGES-1 e.g., inflammation, Alzheimer's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       disease, arthritis, diabetes, cancer, ischaemia or reperfusion injury, or ophthalmic, immunological, cardiovascular or neurological disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               chimeric; antisense oligonucleotide; phosphorothioate; human; microsomal prostaglandin E2 synthase; mPGES-1; mPGES-1 inhibitor; microsomal prostaglandin E2 synthase; mhoES-1; mPGES-1 inhibitor; extoration; antidiabetic; immunomodulator; cardiant; neuroprotective; antidinflammatory; neuroprotective; antidinflammatory; immunomodulatory; cardiant; gene therapy; inflammation; Alzheimer's disease; arthritis; diabetes; cancer; ischaemia; reperfusion injury; ophthalmic disorder; immunological disorder; cardiovascular disorder; neurological disorder; se.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mPGES-1 gene is located on chromosome 9, more specifically to 9434.3. The present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression, (2) a method of inhibiting the expression of mPGES-1 in cels or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antisense oligonucleotides and antisense compounds have cytostatic,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents a chimeric antisense oligonucleotide targeted to human microsomal prostaglandin E2 synthase (mPGES-1). The human mpGES-1 gene is located on chromosome 9, more specifically to offer the present invention also describes: (1) antisense compounds, having a sequence comprising 8-30 bp targeted to a nucleic acid encoding mPGES-1, which specifically hybridise with the nucleic acid mPGES-1 and inhibits its expression; (2) a method of inhibiting the expression of mPGES-1 in cells or tissues; and (3) a method of treating an animal having a disease or condition associated with mPGES-1. MPGES-1 chimeric antidiabetic, immunomodulator, cardiant, neuroprotective, antidiamatic, vasotroprofic antidiamatic, immunomodulatory and cardiovascular activities, and can be used as mPGES-1 inhibitors and in gene therapy. The antisense compound to be used as mPGES-1 inhibitors and in gene therapy. The antisense compound can be used as used dex with mPGES-1 e.g., inflammation, Altheimer's condition associated with mPGES-1 e.g., inflammation, Altheimer's disease, arthritis, diabetes, cancer, ischeemia or reperfusion injury, or cophthalmic, immunological, cardiovascular or neurological disorder.

                                                                     The invention relates to a compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding forkhead box 01A, where the compound is at least 70% complementary to a nucleic acid molecule encoding forkhead box 01A and modulates expression of forkhead box 01A by at least 10%. The compound is useful for treating an animal having a disease or condition associated with forkhead box 01A, e.g. a hyperproliferative disorder (cancer, preferably rhabdomyosarcoma), or type 2 diabetes. This sequence corresponds to an oligonucleotide targeted to the mouse foxhead
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to an antisense compound 8-30 nucleobases in length targeted to a nucleic acid molecule encoding Farnesoid X receptor (FXR), where the antisense compound specifically hybridizes with and inhibits the expression of FXR. The composition and methods are useful for inhibiting the expression of FXR (Farnesoid X receptor) in cells or tissues, or for treating diseases or conditions associated with FXR, such as diabetes, immunological disorders, cardiovascular disorders, e.g. dyslipidemia and its symptoms, atherosclerosis, low HDL (high density lipoprotein), elevated LDL (low density lipoprotein) or hypercholesterolemia, gallstones, hypertriglyceridemia, obesity, neurological disorders, or ischemia/repetrusion injury. In addition, the composition is used for diagnostics, prophylaxis, or as research reagents or kits. This sequence corresponds to an antisense oligonucleotide of the

The invention relates to an antisense compound 8-30 nucleobases in length targeted to a nucleic acid molecule encoding Farnesoid X receptor (FXR), where the antisense compound specifically hybridizes with and inhibits the expression of FXR. The composition and methods are useful for inhibiting the expression of FXR (Farnesoid X receptor) in calls or tissues, or for treating diseases or conditions associated with FXR, such as diabetes, immunological disorders, cardiovascular disorders, e.g. dyslipidemia and its symptoms, atherosclerosis, low HDL (high density lipoprotein), elevated LDL (low density lipoprotein) or hypercholesterolemia, gallstones, hypertriglyceridemia, obesity, neurological disorders, or ischemial/repertrigion injury. In addition, the composition is used for diagnostics, prophylaxis, or as research reagents or kits. This sequence corresponds to an antisense oligonucleotide of the
                                                                                 ss; antidiabetic; immunosuppressive; cardiovascular; antilipemic; antiatreriosclerotic; hepatotropic; litholytic; anorectic; neuroprotective; vasotropic; antisense; gene therapy; Farnesoid X receptor; diabetese; immunological disorder; cardiovascular disorder; dyslipidemia; atherosclerosis; high density lipoprotein; low density lipoprotein; hypercholesterolegilstones; hypertiglyceridemia; obesity; neurological disorder; ischemia; reperfusion; diagnostics; prophylaxis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antisense oligonucleotides useful for modulating expression of Farnesoid X Receptor (FXR) or for treating diseases associated with FXR, e.g. diabetes, immunological disorders, cardiovascular disorders,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    transplant rejection; immune system; rheumatoid arthritis; lupus;

                                                                                                                                                                                                                                                                                                                  Diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, in an individual, comprises detecting the expression level of
                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to diagnosing or monitoring transplant rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, xenotransplant rejection or mechanical organ replacement rejection, in an individual. The method is also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lupus, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or viral, bacterial or fungal infection. The present sequence represents a primer for a 50 mer oligonucleotide marker for diagnosis and monitoring

The present invention relates to antisense compounds targeted to a nucleic acid encoding human/mouse checkpoint kinase 1 (Chk1). The antisense compound comprises an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits the expression of Chk1. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide is a chimeric oligonucleotide in the act one modified undernucleoside linkage, preferably a phosphorothioate linkage. It also comprises at least one modified sugar molety, preferably a 2'.O-methoxyethyl (2'-MOE) sugar molety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methyloytosine. The antisense oligonucleotides are useful for the treatment of diseases such as
                                                                                                                                              New compounds, particularly oligonucleotides targeted to a nucleic acid encoding checkpoint kinase 1, useful for treating diseases associated with checkpoint kinase 1, e.g. hyperproliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /note= "This oligonucleotide has a phosphorothioate backbone and 2'-methyoxyethyl (2'-w05) wings at the 5' and 3' ends, which are 5 nucleotides in length at each end. All cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antisense therapy, mouse, checkpoint kinase 1; Chkl; hyperproliferative disorder; cancer; cytostatic; phosphorothioate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                       The present invention relates to antisense compounds targeted to a mucleic acid encoding human/mouse checkpoint kinase 1 (Chk1). The antisense compound comprises an antisense oligonucleotide that specifically hybridises with the nucleic acid and inhibits the expression of Chk1. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide comprises at least one modified internucleoside linkage, preferably a phosphorothicate linkage. It also comprises at least one modified sugar moiety, preferably a 2'-0-methoxyethyl (2'-MOE) sugar moiety. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methyloytosine. The antisense oligonucleotides are useful for the treatment of diseases such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Mouse; forkhead box O1A; ss; antisense oligonucleotide;

encoding the human forkhead box 01A polypeptide. The compound is an antisense oligonuclectide that specifically hybridises with the nucleic acid and inhibits expression of the polypeptide. The antisense oligonuclectide comprises at least one modified internucleoside linkage i.e. a phosphorothioate linkage, at least one modified sugar moiety, preferably a 2'-O-methoxyethyl sugar moiety, or at least one modified nucleobase comprising a 5-methylottosine. The antisense compounds are useful for modulating the expression of the human forkhead box 01A hypeptide and in preparation of a composition for treating hyperpricilerative disorders, e.g. cancer, preferably rhabdomyosarcoma, and type 2 diabetes. This sequence represents an antisense oligonucleotide targeted to DNA encoding the mouse forkhead 01A
                                                                                                                                                                                                The invention relates to a compound targeted to a nucleic acid molecule
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Counteracting pathologic change in beta-adrenergic signal transduction pathway, by administering compound capable of inhibiting transforming growth factor-beta (TGF-beta) signaling through TGF-beta receptor, to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         failure;

The invention relates to a method for counteracting (MI) a pathologic change in the beta-adrenergic signal transduction pathway which involves administering a compound (I) capable of inhibiting transforming growth factor-beta (TGF-beta) signaling through a TGF-beta receptor, to a drenergic signal transduction pathway. (MI) is useful for counteracting a pathologic change in the beta-adrenergic signal transduction pathway (CC apathologic change results in disease or condition pathway, where the pathologic change results in disease or condition pathway, compensed to flung function. The disease or condition is bronchoconstrictive disease or condition is chosen from emphysema, chronic bronchits, chronic obstructive pulmonary disease (CC bronchits, chronic obstructive pulmonary disease), acute respiratory edema, cystic fibrosis (CF), occlusive lung disease, acute respiratory deficiency syndrome (ARDS), asthma, radiation-induced injury of lung, undied toxins, circulating exogenous toxins or aging, and genetic predisposition to impaired lung function. In an example of the invention, counteract pathologic changes in the beta-adrenergic signal transduction changes in the beta-adrenergic signal transduction contract pathologic changes in the beta-adrenergic signal transduction changes the man and partic to be the man and a perfection changes in the perfect on a PCR primer to amplify
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Cytostatic, Pre-B-cell transformation related gene; PBX; HOX; cancer, HOX heptapeptide region; RT-PCR; primer; ss; HOXA4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ;

Use of peptide that impairs Pre-B-cell transformation related gene-dependent regulation of gene transcription by affecting binding to Hox, for treating or preventing disorders involving aberrant cell division,

Example 4; SEQ ID NO 58; 113pp; English

especially cancer.

```
transformation relates to peptides which impair Pre-B-cell transformation related gene (PBX)-dependent regulation of gene transcription, since they mimic the region of HOX to which PBX binds and act as antagonists of that binding. The peptides are based on the hexapeptide region of HOXB-4 but have been found to have cross-reactivity and reduce the binding of PBX to all HOX proteins. The peptides are act useful for manufacturing a medicament for the treatment or prevention of peptides also further comprise a cell penetration moiety that is linked peptides also further comprise a cell penetration moiety that is linked confirmation the side effects of a cyctoxic or chemotherapeutic agent, or for maintaining or expanding a stem cell population in vivo. The stem cells, which are originally derived from the recipient or individual, may be used in manufacturing a medicament for the treatment or prevention of a condition resulting in a decreased level of stem cells, such as a condition resulting from chemotherapy or radiotherapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The DNA sequences (AAQ50623-28) are obtained by extracting RNA from liver or serum of a patient or chimpanzee infected with NANBHY, synthesising cDNA and detecting the gene fragment which is negative to anti-HCV antibody and cloning the fragment. The derived proteins (AAR44404-08) can be used to detect NANBHY. The DNA and protein are useful in the treatment or prophylaxis of non-A, non-B hepatitis. The primers (AAQ50629-30) are used in the amplification process
                                                                                                                                                                                                                                                                                                                         The present sequence is a RT-PCR which was used in an example from the

This is used in the method of the invention of determining the presence or absence of a mutation conferring a pathological condition mediated by altered ion transport. The method comprises analysing a nucleic acid sample, or protein sample, for the presence of a mutation in the ENAC gene, or in its encoded protein. A vector containing a nucleic acid encoding a human altered variant of the ENAC protein can be used to transform host cells to produce an altered variant of an ENAC protein. The protein can be used to identify agents that effect ion transport. The agonists can be used to treat pathological conditions resulting from abnormal ion transport, such as water retention, increased blood pressure, chronic respiratory and metabolic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention provides a method of diagnosing a vascular disease in an individual, involving determining the sequence at various polymorphic sites within the human thrombospondin 1 and thrombospondin 4 genes. The sequences at a number of polymorphic sites are also provided in the specification. In particular, the method can be used in the diagnosis of atherosclarosis, myocardial infarction, coronary heart disease, stroke, peripheral vascular diseases, venous thromboembolism useful in forensics, patternity testing, genetic analysis and phenotype correlations to diseases. The present sequence is an example of one of the human gene SNPS shown in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Mccarthy JJ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

New frosty polypeptide, a member of 7 transmembrane family of polypeptides and encoding polynucleotide, useful for diagnosing and treating infections, cancer, diabetes, osteoporosis, psychotic and neurological disorders.

Example 8; Page 12; 17pp; English.

The sequences given in AA173045-47 are primers and a probe which were used in TagMan analysis of frosty mRNA. Frosty is a member of the 7 cransmenbrane family of polypeptides and shows homology with ApCRGA.

Frosty is expressed in fetal liver, placenta, testes and uterus. Frosty and the corresponding cDNA are useful as vaccines. Frosty and frosty cDNA are also useful in the diagnossis and treatment of human diseases including allergies, infections such as bacterial, fungal, protozoan, and viral infections, particularly infections caused by human diseases including allergies, bulminia, asthma, Parkinson's disease, diabetes, obesity, anorexia, bulminia, asthma, Parkinson's disease, acute heart failure, hypotension, hypertension, urinary retention, osteoporosis, obesity, anorexia, pulminia, asthma, parkinson's disease, benign prostatic failure, hypotension, womiting, psychotic and neurological disorders including anxiety, schizophrenia, mainc depression, delixium, dementia, severe mental retardation and dyskinesias, such as Huntington's disease or Gilles dela Tourette's syndrome. They are also useful for identifying compounds that may be agonists or antagonists which are also useful in the reapportied for the polypeptide. The antibodies are useful to isolate or to identify the clones expressing the polypeptide or to purify the employed to treat diseases. Frosty is also useful to identify membrane compound or soluble receptor. Frosty is also useful for creating transgenic bound or soluble receptor. Frosty on also useful for membrane controlled and may be also useful so also useful second and knock-out animals, and for chromosome localization studies

Nucleic acid comprising single nucleotide polymorphisms, useful in forensics, paternity testing and diagnosis of disease.

Claim 1; Page 77; 96pp; English.

The invention relates to a nucleic acid comprising single nucleotide polymorphisms (SNPs) associated with diseases. The nucleic acids comprising the SNPs and probes and primers for detecting them may be used in assays for the diagnosis of diseases associated with SNPs (such as sickle cell anaemia, agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Wiskott-Aldrich syndrome, Fabry's disease, familial hypercholesterolaemia, polycystic kidney disease, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary haemorrhagic telangiectasia, familial colonic polyposis, Ehlers-Damios component is or may be genetic, and acute intermittent porphyria, symptoms of, or susceptibility to, multifactorial diseases of which a component is or may be genetic, such as autoimmune diseases.

C inflammation, cancer, diseases of the nervous system, and infection by pathogenic microorganisms, autoimmune diseases including rheumatoid arthritis, multiple sclerosis, diabetes (insilin-dependent and non-contractive diseases). independent), systemic lupus erythematosus and Graves disease, cancers including cancers of the bladder, brain, breast, colon, oesophagus, kidney, leukaemia, liver, lung, oral cavity, ovary, pancreas, prostate, skin, stomach and uterus, longevity, appearance (e.g., baldness, obesity), strength, speed, endurance, fertility, and susceptibility or receptivity to particular drugs or therapeutic treatments), in forensics and in paternity testing. ABK65381-ABK65841 represent human single nucleotide polymorphisms of the invention

```
xylanase (xynA) transcriptional regulatory sequence operably linked to a heterologous coding sequence. Provided is a method for producing a heterologous protein in Aureobasidium pullulans, by up-regulating the expression of a sequence encoding a heterologous protein by adding xylan or xylose to a medium in which a recombinant A. pullulans cell comprising the new isolated nucleic acid molecule is cultured, where the medium contains glucose at a concentration less than 0.02 % (weight/volume) and a xynA transcription regulatory sequence is operably linked to the sequence encoding the heterologous protein, and the heterologous protein is expressed. The nucleic acid containing a signal peptide-encoding sequence, is useful for efficient and economical secreted expression of a protein of interest in a eukaryotic cell, especially a fungal cell such as Aureobasidium pullulans. It may be used as a probe. The proteins produced are widely used in pharmaceutical, food, chemical and other industries. The present sequence represents a PCR primer for amplifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid encoding a signal peptide for efficient and economical secreted expression of a protein of interest in a eukaryotic cell, widely used in pharmaceutical, food and chemical industries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated nucleic acid molecule comprising a

WPI; 2002-698522/75. Guida M, Hall J;

Isolated nucleic acid molecules having polymorphisms in known human genes eg. cytochrome py50 and cathepsin S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for disorder-related traits.

Example 22; Page 144; 714pp; English.

This invention relates to the sequence of an isolated nucleic acid
molecule comprising at least one base variation from that of a known
than eytcohrome P450 al (CYP4501A1), cytochrome P450 A2 (CYP4501A2),
cytochrome P450 02B1 (CYP45002B1), adrenergic receptor betal (ABBR1),
aryl hydrocarbon (AHR), aryl hydrocarbon receptor nuclear translocator
(ARNY), cathepsin S (CYSS), cyclooxgenase 2 (COX2), diazepam binding
inhibitor (BBI), epoxide hydroxylase 2 (EPHX2), 5-lipoxygenase activating
cytochin (FLAPP), glutathione-S-transferase 12 (GST12), histenanine-N-methyl
cytochin (FLAPP), glutathione-S-transferase 12 (GST12), histenanine-N-methyl
cytochin (FLAPP), urbinale (STM), UDP-glucuronosyl
cytochin (UGT2B4), UDP-glucuronosyl transferase 2B7 (UGT2B7), UDP-glucuronosyl
cytransferase (UGT2B1S), urokinase receptor (UGT2B7), UDP-glucuronosyl
cytransferase (UGT2B1S), urokinase receptor (UGT2B7), UDP-glucuronosyl
cytransferase (UGT2B1S), urokinase receptor (URPS), multidrug resistence 1
cytochin (WDR1), lactotransferin (LTF), multidrug resistence associated protein 3
cytochin (WDR1), lactotransferin (LTF), multidrug resistence associated protein 3
cytochin (WDR1), lactotransferin (LTF), multidrug resistence associated protein 3
cytochin (WDR1), lactotransferin (LTF), multidrug resistence associated protein 3
cytochin (WDR1), lactotransferin (LTF), multidrug resistence associated protein 3
cytochin (WDR1), lactotransferin (LTF), multidrug resistence associated protein 3
cytochin (WDR1), lactotransferin (LTF), multidrug resistence associated protein 3
cytochin (WDR1), lactotransferin (LTF), multidrug resistence associated protein 3
cytochin (WDR1), lactotransferin (LTF), multidrug resistence associated protein 3
cytochin (WDR1), lactotransferin (LTF), multidrug resistence associated protein 3
cytochin (WDR1), lactotransferin (LTF), multidrug resistence associated protein 3
cytochin (WDR1), lactotransferin (LTF), multidrug resistence associated protein 3
cytochin (WDR1), lactotransferin (LTF), multidrug resistence associated

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               g
identifying the genes responsible for a variety of disorder-related traits as a result of their e.g., overexpression, constitutive expression, mutation or underexpression, which may be used in diagnosing and/or treating the disorders. The nucleic acid molecules comprising the polymorphic sequences contained in CYP4501A1, CYP4501A2, CYP4502E1, NNMT, NOO2, NR112, STM, UGT2B4, UGT2B7, UGT2B15, AHR, MDR1 and/or MDR3 may also be used to screen individuals for altered drug metabolism. The polymorphic sequences contained in CYP4501A1, CYPP4501A2, AHR, MDR1 and/or MDR3 may also be used to screen individuals for susceptibility to cancer. Polymorphic sequences in ADRB1 or CHMR2 are used to screen function, in CX2 for altered susceptibility to colorectal tumours, in DB1 or CHMR1 for altered central nervous system function, in FLAP and HNMT for altered pulmonary, inmunological or haematological function, in ILK2 for altered central processes activity in the prostate, in LTF for altered central and processes activity in the prostate, in LTF for altered central and contained central and contained contained central and central central central and central central central central and central central central central and central ce
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is that of a 5' primer, which was used with the 3' primer given in ACC58763 for the PCR amplification of the pro-albhal(III) chain. The PCR product was used to prepare a DNA molecule (see ACC58766) encoding a modified pro-alpha chain (see ABR42661) in which decorin replaced the globular domain of the N-propeptide of the pro-alpha(III) chain. This is an example of modified pro-alpha chains of the invention that may form part of a procollagen molecule for incorporation into
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel modified pro-alpha-chain useful for treating wounds and fibrotic disorders, has triple helical forming domain linked to N-terminal domain that contains a polypeptide sequence from proteoglycan protein core.
                                                                                                                                                                                                                                                                                                                                          peripheral nervous system function. The present sequence represents a polymorphic DNA sequence of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Collagen; procollagen; pro-alpha chain; vulnerary; gene therapy; drug delivery; PCR; primer; ss.

The invention relates to a novel polynucleotide isolated and purified from a human gene having any one of 935 fully defined sequences as given in specification, or a sequence having a base substitution. The invention further relates to: an oligonucleotide containing single nucleotide polymorphisms; a PCR primer set chosen from the combination of two DNA fragments from any one of 1201 fully defined sequences as given in specification; a labelling probe containing the SNP containing oligo; and a microarray equipped with the SNP containing oligo. The isolated human gene of the invention is useful for detecting the single nucleotide polymorphisms in human gene. The isolated human gene is also useful for diagnosis of disease and determination of side effect to a medical agent. The isolated human gene is also effective in detecting single nucleotide polymorphism in a human gene. This polynucleotide sequence represents one of the PCR primers used in the single nucleotide polymorphism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

The present invention relates to a method of determining a genotype associated with increased recreased resistance to familial bipolar affective disorder. The method comprises determining the genotype with at least one marker of at least one chromosomal region linked to a locus chromosomal regions are included of and localised between D45402 and D45424, D45431 and D45404, or D113394 and D11529. The invention also discloses a kit for determining a genotype associated with increased or decreased resistance to familial bipolar affective disorder, where the kit comprises markers for two or more of the chromosomal regions cited. The method and kit are useful for determining a genotype associated with increased or decreased resistance to familial bipolar affective disorder in a family affected by bipolar affective disorder in a family affected by bipolar affective disorder in an affective family member, and for assessing an increased or decreased risk of developing bipolar illness for a tested individual from an affective family. ACA58053.ACA58292 represent primers used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Determining a genotype associated with increased or decreased resistance to familial bipolar affective disorder in a family comprises determining the genotype of e.g., chromosomal regions D4S402 and D4S424.
                                                                                                                                                                                    Human; genotype determination; familial bipolar affective disorder; chromosomal region linked; locus associated with resistance; D4S402; D4S424; D4S431; D4S404; D11S394; D1S29; chromosome marker; primer; ss.
                                                                                                                                                    Human familial bipolar affective disorder chromsome marker primer #24.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  0.8%; Score 14.4; DB 1; Length 21; 93.8%; Pred. RESULT 837
                    ACA58076,
```

```
This invention relates to a novel method for analysing chemically modified macromolecules. Specifically, it refers to a high throughput method for the parallel analysis of many potential sites of chemical modification (e.g. methylation) in DNA. The present invention describes treating the DNA with one or more chemical reagents that result in different base sequences depending upon the presence or absence of the modification of interest. Accordingly, a device comprising an array of probes is provided to hybridise with and select the altered DNA sequences that comprise the modifications of interest such as a CpG island. In particular, this invention refers to analysing the methylation partern of a region of the promoter for the tumour suppressor gene p16 from two human lung tumour cell lines H69 and H1618. This oligonucleotide sequence is a human DNA probe used to immobilise CpG methylated DNA of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Analysis of chemical modification of DNA involves obtaining sample of DNA to be analyzed, treating DNA with chemical reagents that result in different base sequences, and determining sequence of resulting DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

modified macromolecules. Specifically, it refers to a high throughput method for the parallel analysis of many potential sites of chemical method for the parallel analysis of many potential sites of chemical medification (e.g. methylation) in DNA. The present invention describes treating the DNA with one or more chemical reagents that result in different base sequences depending upon the presence or absence of the modification of interest. Accordingly, a device comprising an array of probes is provided to hybridise with and select the altered DNA sequences that comprise the modifications of interest such as a CpG island. In particular, this invention refers to analysing the methylation pattern of a region of the promoter for the tumour suppressor gene pl6 from two human lung tumour cell lines He9 and H1618. This oligonucleocide sequence is a human DNA probe used to immobilise CpG methylated DNA of the
                                                                                                                                                                                                                                                        Analysis of chemical modification of DNA involves obtaining sample of to be analyzed, treating DNA with chemical reagents that result in different base sequences, and determining sequence of resulting DNA.
                                                                                                                                                                                                                                                                                                                                                                                           This invention relates to a novel method for analysing chemically
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                probe; ss; chemical modification; methylation; array; CpG island;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention relates to a novel method for analysing chemically modified macromolecules. Specifically, it refers to a high throughput method for the parallel analysis of many potential sites of chemical modification (e.g. methylation) in DNA. The present invention describes treating the DNA with one or more chemical reagents that result in different base sequences depending upon the presence or absence of the modification of interest. Accordingly, a device comprising an array of probes is provided to hybridise with and select the altered DNA sequences that comprise the modifications of interest such as a CpG island. In particular, this invention refers to analysing the methylation pattern of a region of the promoter for the tumour suppressor gene p16 from two human lung tumour cell lines H69 and H1618. This oligonucleotide sequence is a human DNA probe used to immobilise CpG methylated DNA of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Analysis of chemical modification of DNA involves obtaining sample of DNA to be analyzed, treating DNA with chemical reagents that result in different base sequences, and determining sequence of resulting DNA.

This invention relates to a novel method for analysing chemically modified macromolecules. Specifically, it refers to a high throughput method for the parallel analysis of many potential sites of chemical modification (e.g. methylation) in DNA. The present invention describes treating the DNA with one or more chemical reagence that result in different base sequences depending upon the presence or absence of the modification of interest. Accordingly, a device comprising an array of probes is provided to hybridise with and select the altered DNA sequences that comprise the modifications of interest such as a CpG island. In particular, this invention refers to analysing the methylation pattern of a region of the promoter for the tumour suppressor gene pl6 from two human lung tumour cell lines H69 and H1618. This oligonucleotide sequence is a human DNA probe used to immobilise CpG methylated DNA of the
                                                                                                   Analysis of chemical modification of DNA involves obtaining sample of DNA to be analyzed, treating DNA with chemical reagents that result in
                                                                                                                                                                                                                                different base sequences, and determining sequence of resulting DNA.
                                                                                                                                                                                                                                                                                                                                                      Example 1; SEQ ID NO 1102; 210pp; English

Analysis of chemical modification of DNA involves obtaining sample of DNA to be analyzed, treating DNA with chemical reagents that result in different base sequences, and determining sequence of resulting DNA. WPI; 2003-874843/81.

This invention relates to a novel method for analysing chemically modified macromolecules. Specifically, it refers to a high throughput method for the parallel analysis of many potential sites of chemical modification (e.g. methylation) in DNA. The present invention describes treating the DNA with one or more chemical reagents that result in different base sequences depending upon the presence or absence of the modification of interest. Accordingly, a device comprising an array of probes is provided to hybridise with and select the altered DNA sequences that comprise the modifications of interest such as a CpG island. In particular, this invention refers to analysing the methylation pattern of a region of the promoter for the tumour suppressor gene pl6 from two human lung tumour cell lines H69 and H1618. This oligonucleotide sequence is a human DNA probe used to immobilise CpG methylated DNA of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Analysis of chemical modification of DNA involves obtaining sample of DNA

The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel polynucleotide useful for PCR amplification along with two fragment from another set of sequences, or for detecting single nucleotide polymorphism in human gene.
                                                                                                    .;

The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel polynucleotide useful for PCR amplification along with two DNA fragment from another set of sequences, or for detecting single nucleotide polymorphism in human gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             PCR primer 7 for DNA encoding chimeric Ewing's sarcoma-WT1 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Ewing's sarcoma; EWS; EWS-WT1 protein; peripheral neuroectodermal

Diagnosis of desmoplastic small round cell tumours - by detecting nucleic acid encoding chimetic EWS-WT1 nrotain
                                                                                                               transcriptase PCR), and probes for the detection of DNA encoding a chimeric Ewing's sarcoma (EWS)-WT1 protein. EWS is also known as peripherah neuroeccodermal tumour (PMET). WT1 was screened as a breakpoint locus because of its involvement in Wilms' tumour, which shares some histopathologic features of desmoplastic small round cell (DSRC) tumours. The EWS-WT1 chimeric transcript has been detected in 11 out of 12 DSRC tumours studied and in none of 49 other tumours. DSRC tumours are associated with translocation of the EWS gene. The present oligonucleotide is complementary to the WT1 intron 5' to exon 7, and is used in a method for the diagnosis of DSRC tumours in patients. The method comprises detecting a nucleic acid molecule encoding a chimeric EWS-WT1 protein in a sample from the subject, where positive detection indicates the presence of a DSRC tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Polymorphism; biallelic; human; forensic; paternity testing; disease; detection; phenotypia; characteristic; infection; hereditary; autoimmune disease; cancer; inflammation; drug; therapy; medicament; treatment; marker; primer; ss.

forensics, paternity testing or for phenotypic typing for diseases such as agammaglobulinemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, *Miskott-Andrich syndrome, *Rabry's disease, familial hypercholesterolemia, polycystic kidney disease, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary haemorrhagic telangiectasia, familial colonic polyposis, Ehlers-Danlos syndrome, osteogenesis imperfecta, acute intermittent porphyria, autoimmune diseases, inflammation, cancer, diseases of the nervous system, infection by pathogenic microorganisms, and characteristics such as longevity, appearance (e.g. baldhess, obesity), strength, speed, endurance, fertility, and susceptibility or receptivity to particular drugs or therapeutic treatments. The isolated polymorphic nucleic acid segments can also be used to produce medicaments for the treatment or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Reverse and forward (AAV32817) primers were used to amplify the Staphylococcus aureus pcp34 gene. The PCR product was used as a probe in the method of the invention. The invention provides a method of differentiating clinical isolates of S. aureus in isolated genomic DNA samples. The method involves digesting the samples with a restriction enzyme followed by southern blot hybridisation, using DNA probes selected from at least two S. aureus genes, to produce a hybridisation profile which is capable of differentiating S. aureus clinical isolates. The S. aureus genes used as genotypic markers were the collagen adhesin (cna)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Characterizing increased dedifferentiation of cancer cells useful for diagnosing cancer, particularly early cervical cancer, comprises applying body fluids to a foil covered slide and detecting dye-marked cells by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel method for characterizing increased dedifferentiation and micro-metastasis of cancer cells, comprising applying body fluid cells to a carrier and cytodiagnostically examining its cells using micro-dissection to separate cytodiagnostically distinguishable cells from normal cells and performing at least one analysis on the separated cells. The method is used to diagnose cancer,
gene, cnaB gene, cna-up gene, fibronectin binding protein A (fnbA) gene, fnbB gene, beta-toxin (hlb) gene, pcp gene, pcp12 gene and the pcp34 gene. This polymorphic based genetic identification method has proved more specific in identifying epidemiologically related strains than, previous techniques, including polymerase chain reaction, biotyping, insertion sequence typing and plasmid profile analysis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   particularly for the early recognition of cervical carcinoma. This sequence represents a PCR primer used in the amplification of the human Papilloma virus E6 gene used to illustrate the method of the invention

The invention relates to molecules comprising HIV-1 subtype isolate regulatory/accessory genes (tat, nef and rev genes) and modifications and derivatives thereof. The invention also provides proteins encoded by such genes. Sequences of the invention are useful for manufacturing vaccines for treating or preventing human immunodeficiency virus (HIV) infections. They are also useful in gene therapy. The present sequence is a PCR primer used to sequence HIV-1 tat gene. Note: This sequence is a pcr be the same as that shown as SEQ ID NO. 23 in sequence listing. However this sequence has an additional base at its 3' end. (Updated on 27-OCT-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      comprising HIV-1 subtype isolate regulatory/accessory for manufacturing a vaccine for treating or preventing HIV

The present invention describes a method for determining a genetic alteration in a nucleic acid for the diagnosis and management of amalganat disease. The method comprises providing a target nucleic acid from a patient sample, the target nucleic acid having a predetermined sequence in the normal population; and assessing the target nucleic acid for the extent of loss of heteroxygosity relative to predetermined loci, an increased loss of heteroxygosity relative to predetermined loci, an increased loss of heteroxygosity being correlated with enhanced tumour invasiveness and metastasis. Also described is a method for determining the presence or absence of at least one specific nucleotide in a target mucleic acid for the diagnosis and management of malignant diseases. The methods are useful in detecting genetic alterations (e.g. single nucleotide polymorphisms (SNPs)) in a defined polymucleotide region as a means to diagnose and manage malignant diseases such as cancer. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to proteins and their salts and partial peptides which are the expression product of the rat CLCAl gene or are related proteins with similar activity. CLCAl is a calcium activated chloride channel protein. The proteins are useful for the treatment, prevention and diagnosis of chest and airway disorders including chronic obstructive lung disease, chronic bronchitis, bronchial asthma, chronic rhinitis, acute rhinitis, allergic rhinitis, hay fever and pneumonia. This sequence corresponds to a PCR primer used to isolate and clone the rat CLCAl gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Rat CLCAl gene and protein encoded by it useful for screening inhibitors of its activity and expression and as chronic obstructive lung disease and bronchial asthma remedies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               genetic alteration; diagnosis; malignant disease; tumour; metastasis; single nucleotide polymorphism; SNP; cancer; PCR primer; detection; human; chromosome 1; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to a method of designing an antisense compound. The method includes extracting the all-RNA fraction from a cell, incubated with or without the oligomucleotide, and analysing the difference in expression of the gene output to ascertain whether an oligomucleotide produces an antisense effect against the target gene. The method may be useful for the production of compounds with an antianglogenic activity acting as enhancers of vasopermeability whilst the disclosed sequences may be used for antisense therapy. The compounds developed may be used to treat or prevent anglogenesis. The method can be carried out to reduce expression of a target gene without affecting other related to the method of the invention. Note: This sequence does not appear in the specification but was obtained in electronic format from the Japanese patent office.
                                         The invention relates to novel rat airway epithelial cell lines expressing a calcium-activated chloride channel protein (CLCA). A cell line of the invention has antiasthmatic, antiallergic, and antiinflammatory activity. The invention is useful for the treatment and prevention of respiratory disorders, including chronic obstructive lung disease, asthma (including chronic and acute asthma and allergic asthma), hayfever, cystic fibrosis, pulmonary fibrosis and pneumonia. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Designing antisense compound, by inputting oligonucleotide with antisense effect to target gene, extracting RNA, analyzing gene expression,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention comprises the amino acid and coding sequence of the mouse kank (mkank) profein. The DNA and protein sequences of the invention are useful in the detection and treatment of cancer. The present DNA sequence represents a PCR primer for the mouse kank gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              antisense; cytomegalovirus; CMV; human; therapy; prophylaxis; diagnosis; intermediate early complex; IE1; IE2; DNA polymerase gene; ss.

                                                                                                                                                                                                                                                                                                                                                   AAT11971-84 are antisense oligonucleotides (ONS) against human cytomegalovirus (CMV) that displayed activities of at least 50 % of control (ISIS 2922 shown in AAT11961). It was found that up to 4 internal mismatches could be tolerated without loss of antiviral activity.

Antisense ONS targeting CMV DNA or RNA coding for the IB1, IE2 or DNA polymerase proteins have been shown to be effective in therapy, prophylaxis and diagnosis of CMV infection. The ONS may be modified to reduce nuclease resistance and to increase their efficacy. Modifications moieties at the 2' position. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                          New oligo-nucleotide inhibits cytomegalovirus replication - by binding to a portion of cytomegalovirus RNA, for the diagnosis, prophylaxis and treatment of CMV diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              antisense; cytomegalovirus; CMV; human; therapy; prophylaxis; diagnosis; intermediate early complex; IE1; IE2; DNA polymerase gene; ss.

                                                                                                                                                                     New oligo-nucleotide inhibits cytomegalovirus replication - by binding to a portion of cytomegalovirus RNA, for the diagnosis, prophylaxis and treatment of CMV diseases.
                                                                                                                                                                                                                                                                           cytomegalovirus (CMV) that displayed activities of at least 50 % of control (ISIS 2922 shown in AAT11961). It was found that up to 4 internal mismatches could be tolerated without loss of antiviral activity. ISIS 4376 is a 19-mer antisense ON related to ISIS 2292, but with one nucleotide removed from each end. Antisense ONS targeting CMV DNA or RNA coding for the IEI, IEZ or DNA polymerase proteins have been shown to be effective in therapy, prophylaxis and diagnosis of CMV infection. The ONS may be modified to reduce nuclease resistance and to increase their efficacy. Modifications include phosphorothicate backbones, alkyl and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /note="at least one (and preferably all) of the backbone subunits are composed of amide units, so that the oligomer consists of the nucleobases attached covalently

New oligomers are claimed which (A) have at least one peptide nucleic acid (PNA) subunit and (B) have a sequence hybridisable to Aug region, 5 untranblated region, intron/exon (I/B) junction or coding sequence of cytomegalovirus gene eslected from DNA polymerase, IE1 and IE2, or hypridisable to the E, E2, E4, E5, E7, L1 or L2 reading frames of a papillomavirus. The PNAs can be used to target RNA and single stranded DNA (sSDNA) to produce antisense-type gene regulation moieties. Hence they may be used therapeutically for modulating cytomegalovirus and papillomavirus processes and also as diagnostics (e.g., as probes for specific mRNAs). PNA oligomers have high affinity for complementary single stranded DNA. They are also able to form triple halices in which a first PNA strand binds with RNA or ssDNA and a second PNA strand binds with the first PNA strand binds with the first PNA strand binds with the first PNA strand complementation of the resulting double helix or with the first PNA strand complementation cellular uptake. Futher, since they contain amides of non-biological amino acids, they are biostable and resistant to enzymatic degradation by
                                                                                                            New peptide nucleic acid oligomers hybridisable to cytomegalovirus or papilloma:virus - are stable anti:sense molecules with high affinity for single stranded DNA, used for treating infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Identifying simple tandem repeat loci in DNA - by screening DNA library

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             8
                                                                                                                                                                                                            New oligomers are claimed which (A) have at least one peptide nucleic acid (PNA) subunit and (B) have a sequence hybridisable to AUG region, intron/exon (I/B) junction or coding sequence of cytomegalovirus gene selected from DNA polymerase, IEI and IEZ, or cytomegalovirus gene selected from DNA polymerase, IEI and IEZ, or hybridisable to the E, EZ, E4, E5, E6, E7, L1 or L2 reading frames of a papillomavirus. The PNAs can be used to target RNA and single stranded DNA (spDNA) to produce antisense-type gene regulation moieties. Hence they may be used therapeutically for modulating cytomegalovirus and papillomavirus processes and also as diagnostics (e.g., as probes for specific mRNAs). PNA oligomers have high affinity for complementary single stranded DNA. They are also able to form triple helices in which first PNA strand binds with RNA or seDNA and a second PNA strand binds with the resulting double helix or with the first PNA strand binds cossess no significant charge and are water soluble, which facilitates cellular uptake. Futher, since they contain amides of non-biological amino acids, they are biostable and resistant to enzymatic degradation by exceeding the processes. The present sequence targets CWV IEZ nuclear localisation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ő
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 /note= "at least one (and preferably all) of the backbone subunits are composed of amide units, so that the oligomer consists of the nucleobases attached covalently to a polyamide backbone"
                                                                                                        New peptide nucleic acid oligomers hybridisable to cytomegalovirus or papilloma:virus - are stable anti:sense molecules with high affinity for single stranded DNA, used for treating infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       peptide nucleic acid; PNA; cytomegalovirus; CMV; papillomavirus; antiviral; diagnostic; ss.

                                                                              AAQ95226 and AAQ95227 are a primer pair for the PCR amplification of the simple tandem repeat (STR) corresponding to wgla3. The STR can be used for treatment and diagnosis in human and veterinary medicine, partic. for generic characterisation, mapping, linkage studies and analysis/diagnosis of acquired disease alleles
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAT10877-T10898 are PCR primers used for the amplification of the human eytochrome P4501A2 gene. They are used in a method for detecting cytochrome P4501A2 gene polyworphism, in partic. for detecting a T to G base substitution at position 2064 or a C to A substitution at position 2064 or a C to A substitution at position at 4640. The method is easy, convenient and has a high degree of sensitivity and accuracy. Polymorphisms in the P4501A2 gene can lead to a modification of metabolism which may be beneficial or deleterious
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detection of human cytochrome p4501A2 gene polymorphism - useful in gene diagnosis of metabolic activity polymorphism.
                                                                                                                                                                                                                                                              Gaps
to enrich for fragments contg. the repeats before cloning and rescreening, also simple tandem repeats for treatment or diagnosis.
